SF Rima is a permeable paving stone that allows stormwater to percolate back into the ground rather than run off the surface. This infiltration can regenerate valuable groundwater tables, control erosion and improve stormwater runoff quality. It also reduces the amount of runoff flowing into stormwater systems. SF Rima pavements are eligible for LEED credits under the U.S. and Canadian Green Building Council guidelines.

Turfstone's grid pattern allows grass to grow while protecting the root system from compaction by vehicular traffic. It is ideal for greenbelts that require occasional vehicle use such as overflow parking and fire access lanes. Turfstone pavements with established grass reduces stormwater runoff and lowers the reflected temperatures associated with impenetrable surfaces.

## SHADOW & LIGHT AFFECTS COLOR

Color — and the perception of color — is greatly affected by multiple factors. These photos of Sand-Stone-Mocha Courtyard Stone were all taken on the same day at the same property. When photographed before sunset and shortly after sunset, you can see how the light of day changes the color. It is this change in light, throughout the day, that creates beautiful variations of color. Consequently, photographic conditions, the time of day, the weather, the paver's texture and manufacturing conditions — even the quality of the printed page or website image — can all affect the perception of paver colors. And, because these conditions are variable, Angelus always recommends viewing physical samples prior to installation. Angelus Pavers & Walls. Beautiful in any light.
